SOFTWARE DISTRIBUTION CLIN 0048

06 Jan 2005

For the NMCI Release Deployment Process (NRDP), the Developer must use either of two methods:

- For individual or small numbers of NMCI seats, use a Deployment Service Request [Moves, Adds, Changes (MAC)].
- For large numbers of NMCI seats, use a Software Distribution CLIN 0048.

Normally, the release is packaged (Radia) for electronic deployment into NMCI and is supported by either an administrative (Admin) MAC or a Distribution CLIN 0048. If the release cannot be packaged for electronic deployment, a Physical MAC is the only method available.

NOTE: Local load uses a physical MAC at the local site/Command only.

CLIN 0048 Software Distribution is the contract vehicle to electronically distribute new and/or updated NMCI-certified software applications to all authorized users. This service is not required for software required from the CAP for compliance with Section 508 of the Rehabilitation Act.

Software applications include any new/emerging software application or subsequent update, including upgrades, modifications, patches, and/or fixes that have been certified under CLIN 0047 or prior certification methods. An authorized user is an NMCI seat that is not restricted from receiving the software application and is appropriately licensed to receive the software application. The Government is responsible for ensuring that the software application is appropriately licensed for distribution under this CLIN.

Electronic distribution means that software is pushed to clients over the local area network (LAN). If manual installation is needed, the Government must submit a MAC request or reengineer the application and order its installation on a separate task order. However, if the Contactor is responsible for the inability to electronically distribute because of its actions or inactions, the Contractor will manually install the software application at no additional cost to the Government.

Pricing for CLIN 0048 is further broken into a single initial event (0048AA) and single additional events (0048AB).

CLIN 0048AA SOFTWARE DISTRIBUTION (INITIAL EVENT)

This service provides for a one-time distribution event of a software application packaging instance and associated supplemental packaging instances to unlimited authorized users. A "distribution event" is a single occasion upon which the Contractor electronically deploys one or more software application packaging instances to authorized users.

CLIN 0048AB SOFTWARE DISTRIBUTION (ADDITIONAL EVENTS)

This service provides for deployment of the software application packaging instance and associated supplemental packaging instances via a series of distribution events when a single distribution event is not sufficient to meet the Government's deployment objectives due to Government-related issues. These issues may include but are not limited to incremental, phased, or stepped deployments; scheduling; environmental and/or operational constraints. The CLIN 0048AB allows phased deployments through a series of distribution events. This CLIN must be ordered in conjunction and simultaneously with CLIN 0048AA Software Distribution (Initial Event). All such additional distribution events must occur within 12 months, and must be based on a mutually agreed distribution Plan of Action & Milestones (POA&M).
